

Benefits

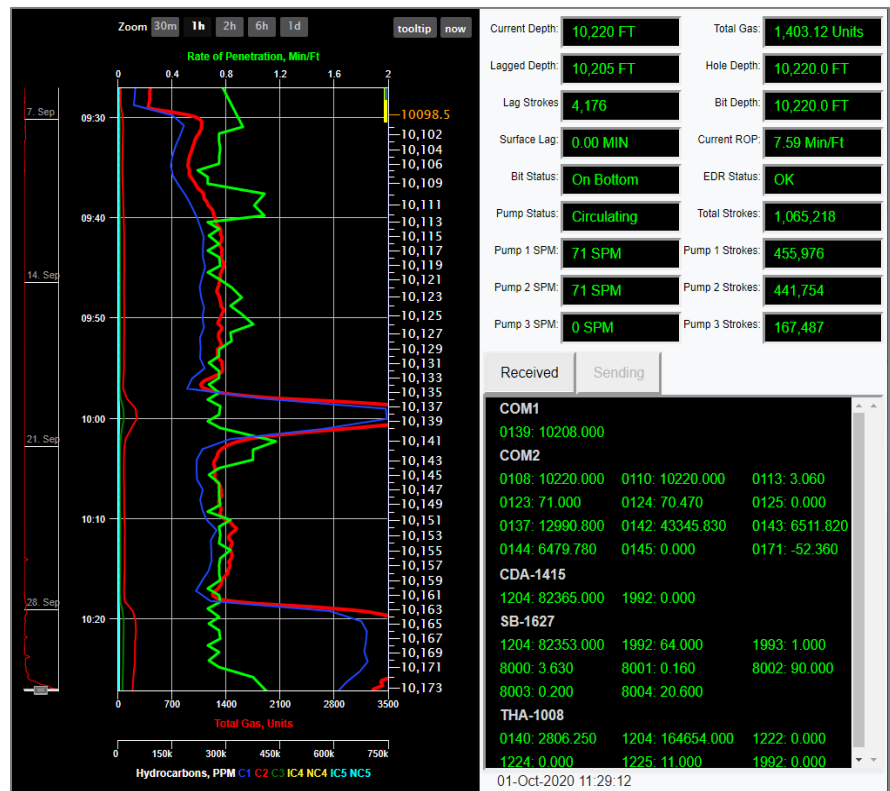

A next generation web-enabled graphical logging application, Link-n-Log is the software that powers the Link Box; it is the controller, display, and editor for all incoming data. Running in any modern web browser, there is no software to download and install. Using standard WITS protocol, it can Link, Log, and Lag data from any device on the modern wellsite, including any EDR, Terra's own FID, any Mass Spec or other 3rd Party devices.

Embedded Web App

- Built using latest HTML5 technology, it is a responsive interface inside any modern web browser
- Simple and easy to use graphical editor based on our pioneer software, TControl
- Combine each sensor or instrument in one complete time-based dataset and easily export the data to a time-based or depth-based LAS

Features

- Edit interpreted data – Raw sensor data is collected with a unique time stamp and any data that is interpreted from raw data or WITS feed may be edited. This gives loggers the ability to line up the lag profile perfectly while ensuring raw gas data remains intact
- WITS In/Out – WITS feeds via Serial or Ethernet can change units in real time for transmission back to the EDR, in addition to normalizing data in real time
- Flexible at its core - At a glance, you can see all data parameters coming into the application in the WITS Monitor. Quickly diagnose any miscommunication with other vendors or the rig's EDR system. Export depth-based data in any format or unit.
- Provides quick access to the Five Guys FID devices

Requirements

- Google Chrome is the required web browser for viewing the Link-n-Log webpage
- An internet connection is NOT required
